Data Type

quantitative

Language

German

Abstract

The representative survey (n=1.001) aims to examine the relation between media (use) and social cohesion by focussing on four key questions: (1) How do citizens assess different media types with regard to their contributions to social cohesion. (2) How do citizens assess specific aspects of professional journalistic work. (3) How do these assessments differ between groups with different sociodemographics and different media repertoires? (4) How do these assessments relate to different conceptions of social cohesion?
